Bibbla Developer's guide

Version 0.1
Arild Matsson, 2012-10-02

This document is definitely subject to change, and might be slightly outdated. Contact Bibbla developers for help.

Acquiring source

Clone the GitHub repository.

```
git clone git@github.com:aommm/bibbla.git
```

Import the projects to Eclipse. The repository contains three Eclipse projects for the app, additional libraries, and backend testing respectively.

Setting up Eclipse

The projects must be named accordingly: Bibbla (app), ActionBarSherlock (libs) and BackendDebugging (tests).

Ensure that *Compiler compliance level* setting is set to 1.6 in the properties of all projects.

Note: Even though the BackendDebugging project does not make any use of the ActionBarSherlock project, the latter must be present.
